## Finger Guard #2248

National Guard Products Finger Guard #2248 is designed to help prevent injury to children or others who may place their fingers behind the hinge edge of a door when it is open and then be injured when the door is closed by another person or a door closer. This unique product features an internal spring mechanism that maintains constant tension against the polyethylene fabric.

This prevents fingers from entering the dangerous area behind the edge of the door. This item is available in lengths of 76" or 82" for most doors and 38" for Dutch door applications.

Available in clear anodized aluminum with white polyethelene material and dark bronze anodized aluminum with black polyethelene material.

Unlike some other products that have been on the market - this Finger Guard is a quality item that really works! We warranty it for 5 years regardless of the amount of cycles it performs. It is UL certified for use on fire doors rated up to 3 hours metal doors and 1-hour on wood doors.

2248A - Clear anodized aluminum with white polyethylene  
2248DKB - Dark bronze anodized with black polyethylene

### Sample Request

If you would like to see a sample of this product to review with an Architect on an upcoming project, please email us at [info@ngpinc.com](mailto:info@ngpinc.com) and tell us you want a 2248A or 2248B 18" working sample.
